طراحی یک انکوباتور آزمایش ششم

تاریخ گزارش: ۸ اردیبهشت ۱۴۰۳

۱ شرح آزمایش

در این آزمایش هدف بر آن است که واحد کنترل یک سیستم دیجیتال را برنامه نویسی کنیم. در واقع ورودی ها با یک حسگر دما دریافت می شوند و سپس سیستم fan را روشن می کنند. لازم به ذکر است که کولر دارای یک فن fan می باشد که دور موتور آن نیز با استفاده از دمای کنونی تعیین می شود. تمام حالت های این سیستم در قالب نمودار زیر آورده شده اند:

۲ ماژول ها

AC 1.Y

ساختار این ماژول به صورت زیر می باشد:

```
always @(state) begin
                                           case (state)
                                                begin
                                                     cooler <= 0;
                                                     heater <= 0;
                                                begin
                                                     heater <= 0;
                                                     cooler <= 1;
                                                end
                                                begin
                                                     heater <= 1;
                                                     cooler <= 0;
end
'53:
begin

if (sensor > 30) state <- `51;
                                      end
                                 endmodule
```

همان طور که مشاهده می شود ابتدا با استفاده از یک کیس، حالتی که در آن هستیم با استفاده از مقدار دما مشخص می شود و سپس، دو خروجی Heater و Cooler با استفاده از آن مشخص می شوند.

Fan Y.Y

ساختار این ماژول به صورت زیر می باشد:

در این ماژول نیز مانند قبلی، با توجه به دمای ورودی، ابتدا حالت کنونی سیستم را مشخص کرده و سپس بر اساس آن دور موتور را مشخص میکنیم.

Incubator 7.7

ماژول نهایی سیستم می باشد که ساختارش به صورت زیر است:

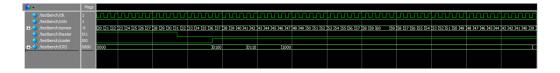

در این ماژول، از دو سیستمی که در بالا ساختیم دو instance می گیریم تا بتوان به طور همزمان خروجی ها را تحت نظر گرفت. ورودی ها توسط بورد یا کد تست بنچ داده می شوند.

testbench 4.4

در آخر، با استفاده از تست بنج عملکرد مدار را بررسی می کنیم:

```
| The matter of the matter of
```

که نتیجه به صورت زیر می باشد:

در آخر، خروجی ترمینال نیز به صورت زیر می باشد که عملکرد درست سیستم را نشان می دهد:

```
0 tempreture: -10, AC_state=1, Fan_state=0, HEAT=1, COOL=0, CRS= 0
